Joel Choppavarapu

choppavarapujoel@gmail.com | linkedin.com/in/joel-choppavarapu-424691303 | github.com/Joel-Judson-Paul77 | poptle.com

Education

NBKR Institute of Science and Technology — Andhra Pradesh, India
Bachelor of Technology in Computer Science and Engineering — Aug. 2024 to Jun. 2028

Experience

Founder and Product Engineer — Jul. 2026 to Present
POPTLE | Kotlin, Jetpack Compose, Room, Play Billing, Render — Remote

- Designed, built and launched an Android app on **Google Play** using Kotlin and Jetpack Compose that sorts every notification into 4 attention zones (Needs Action, People, Updates, Background) so important alerts are never buried
- Architected a layered classification pipeline of deterministic rules, on-device AI and cloud AI as a last resort, keeping most decisions offline and server usage within free-tier limits
- Built a trust layer that flags notifications engineered to impersonate real people
- Integrated Google Play Billing with **server-side purchase verification** for Pro, instead of trusting a client-side flag
- Deployed the backend on Render and the product site (poptle.com) on Vercel with automatic deploys from GitHub

Data Science Intern — Jan. 2024 to Feb. 2024
Teachnook (Teachscape Online Learning Services) — Internship

- Completed the Data Science course and mentorship internship (with Cognizance'24 IIT Roorkee), covering data science fundamentals, Python and analytical problem-solving

Projects

ResolveAI | *n8n, Gemini API, Webhooks, JavaScript* — 2026

- Built an AI support-triage workflow on **n8n cloud**: a webhook receives a customer message, Gemini scores intent, urgency and sentiment, and the workflow routes it to the right action in **1 to 3 seconds**
- Tested every route end to end, then tightened the prompt's definitions of angry and urgent so escalations stop firing on ordinary complaints
- Built a web console to send messages and see routing results; now extending the prototype toward a B2B product (persistence, order connectors, automated replies, widget)

CloneX | *Next.js, TypeScript, React, Tailwind, Vitest, n8n* — Oct. 2026

- Co-built a **brand-impersonation monitor** with a team of five: it scans the Apple App Store, Google Play, Bluesky, Telegram and certificate-transparency logs for look-alikes and scores each from 0 to 100 with stated reasons
- Measured accuracy on a held-out set the model had not seen: **87% precision, 76% recall, 81% F1**, and documented known limits in the README instead of reporting only the dev-set 100%
- Added logo-hash matching with *sharp*, a **74-test Vitest suite** with CI, and an n8n takedown workflow where an analyst reviews each case before anything is sent

Hackathons and Achievements

- **Top 3 of 28 teams** at the college round of **HacXLerate 2026** (byteXL), as team Byte Syndicate from NBKRIST; advanced to Round 2, a 14-hour in-person buildathon in Hyderabad
- **Best Use Case of QSDC** award, QC² Quantum Computing Conclave National Hackathon, SRM University AP (team Quantum Insiders), for work on Quantum Superdense Coding
- Built ResolveAI at **TechTatva 2K26** and kept developing it past the event

Technical Skills

Languages: Kotlin, TypeScript, JavaScript, Python, HTML/CSS
Frameworks and Libraries: Jetpack Compose, Room, WorkManager, Next.js, React, Tailwind CSS, Vitest
AI and Automation: Gemini API, n8n workflows, MediaPipe GenAI, Ollama
Cloud and Tools: Vercel, Render, Google Play Console and Billing, Git/GitHub, GitHub Actions CI, Android Studio
